Fibre selection via the actual Hopf fibres of $SO(3)$

a base point on S^2 selects a fibre (a great circle of rotations in $SO(3) \cong S^3$); the roll ψ is the position along that fibre

its fibre

**base point on S^2 (a HEALPix bin)
selects ‘which fibre’**

**the actual Hopf fibre $S^1 \subset SO(3)$ (stereographic)
hue = roll ψ, gold = the chosen roll bin**
